## Stephen Hanna 109097796

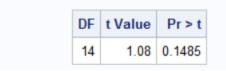

### HW8

#### **Problem 1:**

```
data ProcessingTime;
Input ProcessingTime @@;
datalines;
28 25 27 31 10 26 30 15 55 12 24 32 28 42 38;
proc print data = ProcessingTime;
title 'Processing Time'
run;
proc univariate     data=ProcessingTime normal;
var ProcessingTime;
run ;
proc ttest h0=25 data=ProcessingTime sides=u alpha=.05;
var ProcessingTime;
run;
```

| Tests for Normality |                   |          |           |         |  |  |  |
|---------------------|-------------------|----------|-----------|---------|--|--|--|
| Test                | Statistic p Value |          |           |         |  |  |  |
| Shapiro-Wilk        | W                 | 0.941665 | Pr < W    | 0.4038  |  |  |  |
| Kolmogorov-Smirnov  | D                 | 0.169887 | Pr > D    | >0.1500 |  |  |  |
| Cramer-von Mises    | W-Sq              | 0.07693  | Pr > W-Sq | 0.2177  |  |  |  |
| Anderson-Darling    | A-Sq              | 0.428232 | Pr > A-Sq | >0.2500 |  |  |  |

p>.05 for normality testing, so the data is assumed to be normally distributed.

p>.05, so we do not reject the null hypothesis. The processing time is not significantly greater than 25 minutes.

# **Problem 2:**

```
data Hypertension;
Input Temperature $ BloodPressure;
datalines;
26 152
26 157
26 179
26 182
26 176
26 149
5 384
```

```
5 369
5 354
5 375
5 366
5 423
;
proc print data = Hypertension;
title 'Temperature dependent influence on blood pressure'
run;
proc univariate data=Hypertension normal;
var BloodPressure;
by Temperature;
run ;
proc ttest data=Hypertension sides=2 alpha=0.05 h0=0;
Class Temperature;
var BloodPressure;
run;
```

| Tests for Normality |                   |          |           |         |  |  |  |
|---------------------|-------------------|----------|-----------|---------|--|--|--|
| Test                | Statistic p Value |          |           |         |  |  |  |
| Shapiro-Wilk        | W                 | 0.85134  | Pr < W    | 0.1614  |  |  |  |
| Kolmogorov-Smirnov  | D                 | 0.254371 | Pr > D    | >0.1500 |  |  |  |
| Cramer-von Mises    | W-Sq              | 0.077782 | Pr > W-Sq | 0.1896  |  |  |  |
| Anderson-Darling    | A-Sq              | 0.454293 | Pr > A-Sq | 0.1737  |  |  |  |

| Tests for Normality |                   |          |           |         |  |  |  |
|---------------------|-------------------|----------|-----------|---------|--|--|--|
| Test                | Statistic p Value |          |           |         |  |  |  |
| Shapiro-Wilk        | W                 | 0.869398 | Pr < W    | 0.2238  |  |  |  |
| Kolmogorov-Smirnov  | D                 | 0.24254  | Pr > D    | >0.1500 |  |  |  |
| Cramer-von Mises    | W-Sq              | 0.0744   | Pr > W-Sq | 0.2112  |  |  |  |
| Anderson-Darling    | A-Sq              | 0.444501 | Pr > A-Sq | 0.1864  |  |  |  |

The shapiro test demonstrates that both sets of values for respective temperatures are normally distributed since p>.1 in both cases.

|        |           |        |      |      | Equality | of ' | Varia | ance             | es    |           |             |         |         |         |
|        |           | Met    | hod  | N    | um DF    | Dei  | DF    | F                | Value | Pi        | > F         |         |         |         |
|        |           | -      | ded  | _    | 5        |      | 5     |                  | 2.63  |           | 3121        | -       |         |         |

The p value for the equality of variances is greater than .05, so the two variances are assumed to not be statistically different. Thus, the pooled t test value will be used. The p value is less than .0001, so we can reject the null hypothesis and state that **the mean blood pressure at different temperatures is significantly different** 

### **Problem 3:**

```
data CornYield;
Input VarA $ VarB;
diff = varA - varB;
datalines;
48.2 41.5
44.6 40.1
49.7 44.0
40.5 41.2
54.6 49.8
47.1 41.7
51.4 46.8
;
proc print data = CornYield;
title 'Corn Yields for different varieties'
```

| Tests for Location: Mu0=0 |                   |          |          |        |  |  |  |
|---------------------------|-------------------|----------|----------|--------|--|--|--|
| Test                      | Statistic p Value |          |          |        |  |  |  |
| Student's t               | t                 | 4.908079 | Pr >  t  | 0.0027 |  |  |  |
| Sign                      | M                 | 2.5      | Pr >=  M | 0.1250 |  |  |  |
| Signed Rank               | S                 | 13       | Pr >=  S | 0.0313 |  |  |  |

| Tests for Normality |                   |          |           |         |  |  |  |  |
|---------------------|-------------------|----------|-----------|---------|--|--|--|--|
| Test                | Statistic p Value |          |           |         |  |  |  |  |
| Shapiro-Wilk        | W                 | 0.756933 | Pr < W    | 0.0150  |  |  |  |  |
| Kolmogorov-Smirnov  | D                 | 0.369078 | Pr > D    | <0.0100 |  |  |  |  |
| Cramer-von Mises    | W-Sq              | 0.153764 | Pr > W-Sq | 0.0166  |  |  |  |  |
| Anderson-Darling    | A-Sq              | 0.838808 | Pr > A-Sq | 0.0163  |  |  |  |  |

The data is paired. The data is not normal, since the p value is less than .05 for the shapiro- wilk test. Thus, we use the p value for the Wilcoxon signed rank test. The p value is less than .05, so we reject the null hypothesis and conclude, with over 95% confidence, that the means between the two yields are not the same.

# **Problem 4:**

```
data SalesData;
Input Before $ After;
diff = after-before;
datalines;
12 18
18 24
25 24
9 14
14 19
16 20
;
proc print data = SalesData;
title 'Sales before and after training';
run;
proc univariate data=SalesData normal;
var diff;
run;
```

| Tests for Location: Mu0=0 |                   |          |          |        |  |  |  |
|---------------------------|-------------------|----------|----------|--------|--|--|--|
| Test                      | Statistic p Value |          |          |        |  |  |  |
| Student's t               | t                 | 3.866801 | Pr >  t  | 0.0118 |  |  |  |
| Sign                      | M                 | 2        | Pr >=  M | 0.2188 |  |  |  |
| Signed Rank               | S                 | 9.5      | Pr >=  S | 0.0625 |  |  |  |

| Tests for Normality |                   |          |           |        |  |  |  |
|---------------------|-------------------|----------|-----------|--------|--|--|--|
| Test                | Statistic p Value |          |           |        |  |  |  |
| Shapiro-Wilk        | W                 | 0.735678 | Pr < W    | 0.0144 |  |  |  |
| Kolmogorov-Smirnov  | D                 | 0.308159 | Pr > D    | 0.0739 |  |  |  |
| Cramer-von Mises    | W-Sq              | 0.138153 | Pr > W-Sq | 0.0242 |  |  |  |
| Anderson-Darling    | A-Sq              | 0.77049  | Pr > A-Sq | 0.0211 |  |  |  |

The data is paired. The data is not normal, since the p value is less than .05 for the shapiro- wilk test. Thus, we use the p value for the Wilcoxon signed rank test. However, the p value has to be halved when testing whether one data set is greater than the other, rather than one ranked data set simply being significantly different than the other. Hence, the p value used is .0625/2, or .03125. The p value is greater than .01, so we cannot reject the null hypothesis. **The sales before cannot be concluded, with 99% confidence, to be significantly less than the sales after.**
